

**March 20, 2022**

**Dear Members of the FDA, VRBPAC AND CDC;**

**RE: REJECT the Pfizer EUA application to inject mRNA into kids 6 months to 4 years old when it returns in April**

---

I would like the FDA to carefully consider the following evidence prior to deliberating on the continuance of mRNA products in the population, particularly in children 6 months to 4 years.

**One life lost or injured to these novel products is one too many.**

**Already governments are planning to reimburse families for burial costs for those deaths related to these novel mRNA products. Here's [Canada's announcement](#). Insurance companies are planning not to cover such costs, because they view these as experimental drugs, and death is considered a voluntary suicide and not covered by their policies.**

**Here's what the scientific community and most of us know:**

- During the 1976 swine flu, after 40 million doses of the novel vaccine killed just 25 persons, the vaccine was removed from the market. What is the cut-off for deaths in relation to these mRNA inoculations?
- Study entitled, *Why are we vaccinating children against COVID-19?* by Kostoff *et al.* concludes: "A novel best-case scenario cost-benefit analysis showed very conservatively that there are five times the number of deaths attributable to each inoculation vs those attributable to COVID-19 in the most vulnerable 65+ demographic. The risk of death from COVID-19 decreases drastically as age decreases, and the longer-term effects of the inoculations on lower age groups will increase their risk-benefit ratio, perhaps substantially."
- Since the vaccine mandates and jabs began, there has been an 84% increase in all cause mortality of millennials (ages 22-44) according to CDC data and a 40% uptick in non-COVID-19 deaths of persons ages 18-64 as reported through the [insurance industry](#) (and [here](#)).
- There has been a startling increase in healthy vaccinated child-bearing age women who have been hospitalized with blood clots in the brain. ([here](#), [here](#) and [here](#)).
- Over 350 American athletes have suffered heart-related events, many collapsing in play, soon after taking the jabs. (compilation [here](#)). It is likely that the several fold more athletes have suffered subclinical damage of their heart and other organs that will manifest at a later date.

## REJECT the Pfizer EUA application to inject mRNA into kids 6 months to 4 years old when it returns in April 2022

---

- The Pfizer data dump—which Pfizer had asked to keep hidden for 75 years—along with [whistleblowers](#) from Pfizer study groups have [demonstrated](#) that the FDA cannot rely upon Pfizer’s own data regarding safety or efficacy. For example, they did not disclose 1223 deaths from Dec 1/20 to Feb 28/21 which should have shut down the entire program.
- The 9 pages in [Appendix 1](#) of the Pfizer data dump that list over 1250 disease indications known or potentially linked to their COVID-19 vaccine should give all of us reason to pause.
- Information about the harmful side-effects of the synthetic mRNA injections has gone viral such as the video entitled “*The Pfizer Inoculations: More Harm than Good*” ([link](#)), which identifies serious flaws in how the Pfizer phase III clinical trials were performed and a careful scientific examination of the data.
- Here is a physician/researcher from the UK and his review of the Pfizer data thus far. ([Link](#))
- CDC Says It Accidentally Inflated Children’s COVID Death Numbers In ‘Coding Logic Error’ | [The Daily Caller](#). Clearly children with few ACE2 receptors are not at risk for getting COVID-19 or any of its variants.

### CONCLUSIONS:

#### 1. There is no COVID-19 emergency for children under five years old.

- Children have a 99.995% recovery rate and a body of medical literature indicates that almost zero healthy children under five years old have died from COVID-19.
- A large [study](#) conducted in Germany showed zero deaths for children under 5 and a case fatality rate of three out of a million in children without comorbidities.
- A [Johns Hopkins study](#) monitoring 48,000 children diagnosed with COVID-19 showed a zero mortality rate in children under 18 without comorbidities.
- A [study](#) in *Nature* demonstrated that children under 18 with no comorbidities have virtually no risk of death.

#### 2. The Pfizer mRNA shot does not work very well in kids.

- The Pfizer clinical trial in kids 6 months to four years old failed in [December 2021](#) and failed again in [February 2022](#). Adding a third dose is not going to solve the underlying problems with this shot in this age group.
- The FDA and CDC claimed that the Pfizer shot was 90% effective in kids 5 to 11. Recently released data show that it was only [12% effective](#) against the Omicron variant. So all of the FDA and CDC risk benefit calculations were wrong.
- By contrast, there are more than [1,500 studies](#) in connection with about twenty off-the-shelf medicines that are safe and effective. Prophylaxis and early treatment with these medicines offer a better alternative than risky mRNA shots.

## **REJECT the Pfizer EUA application to inject mRNA into kids 6 months to 4 years old when it returns in April 2022**

---

### **3. The harms from the Pfizer mRNA shot in children are catastrophic.**

- There are now 43,760 VAERS reports of adverse events in children following COVID-19 shots. These reports likely *understate* harms by a factor of 41 to 100.
- There are troubling reports of fatalities in children following COVID-19 shots:  
<https://openvaers.com/covid-data/child-reports/1975356>  
<https://openvaers.com/covid-data/child-reports/2109625>  
<https://openvaers.com/covid-data/child-reports/2152560>  
[https://www.icandecide.org/ican\\_press/report-of-toddlers-death-disappears-from-vaers-and-cdc-has-no-records-as-to-why/](https://www.icandecide.org/ican_press/report-of-toddlers-death-disappears-from-vaers-and-cdc-has-no-records-as-to-why/)

It is clear that the public no longer trusts the mRNA products based on the poor uptake of the booster shots. Moreover, we have little to no trust in these products for our children based on the scientific findings and literature. Unfortunately, the failure of the synthetic mRNA inoculations has led many Americans and persons internationally to lose confidence in the medical and scientific community and in vaccines entirely.

We understand that FDA authorization = CDC adding it to the childhood schedule = liability protection forever = mandates = widespread iatrogenic injury.

**Each of you have a professional and moral obligation to reject Pfizer's EUA application for kids 6 months to 4 years old and, hopefully, place a ban on mRNA inoculations for COVID-19 permanently.**

I anxiously await hearing back from you.

Sincerely yours,

A health care professional

*As a disclaimer, I am neither a physician, a virologist, a molecular biologist or an immunologist, but rather a health care professional who is interested in saving Canadian lives.*
